

5 What is claimed as being new and desired to be protected by Letters Patent of the United States is as follows:

1. A guidance device for a domestic animal comprising:
 a. a primary collar section having a first end and a second end;
 b. a secondary collar section connected to one of the first end and the second
10 end of the primary collar section; and

 c. means for reversibly connecting the secondary collar section and the other
of the first end and the second end of the primary collar section,
 said means for reversibly connecting having a longitudinal axis and
being independent of internal rotation about said longitudinal axis, and

15 said means for reversibly connecting having a reversible fastener for
attaching to one of the secondary collar section and the other of the first end and the second end of
the primary collar section,

 whereby, the guidance device can be attached to the neck of the
20 domestic animal independent of twisting of the secondary collar section.

2. The guidance device for a domestic animal of claim 1, wherein the means for
reversibly connecting has an aperture and an opening with said opening being associated with the
reversible fastener,

 said aperture lying generally in a first plane and said opening lying generally
25 in a non-parallel second plane.

5 c. said means for reversibly connecting being slidably engaged to the secondary collar section; and

 d. means for reversibly connecting the secondary collar section and the other of the first end and the second end of the primary collar section,

 said means for reversibly connecting having a longitudinal axis and
10 being independent of internal rotation about said longitudinal axis,

 said means for reversibly connecting having a reversible fastener for attaching to one of the secondary collar section and the other of the first end and the second end of the primary collar section,

 said reversible fastener of the means for reversibly connecting having
15 a latch disposed outwardly relative to the neck of the domestic animal,

 whereby, the guidance device can be attached to the neck of the domestic animal independent of twisting of the secondary collar section.

 10. The guidance device for a domestic animal of claim 9, wherein the means for reversibly connecting has an aperture and an opening with said opening being associated with the
20 reversible fastener,

 said aperture lying generally in a first plane and said opening lying generally in a non-parallel second plane.

 11. The guidance device for a domestic animal of claim 10, wherein a line normal to the first plane is perpendicular to a line normal to the second plane.

25 12. The guidance device for a domestic animal of claim 10, wherein the secondary collar section comprises a chain having a first end connected to one of the first end and the second

5 end of the primary collar section, a second end with a rotatable lead connector, and the secondary collar section comprises a restrictor of suitable size to prevent the means for reversibly connecting from sliding so far along the secondary collar section that the domestic animal can be choked by the guidance device.

13. The guidance device for a domestic animal of claim 1, wherein the primary
10 collar section comprises a plurality of prong links operably connected to form a flexible chain.

14. The guidance device for a domestic animal of claim 1, wherein the means for reversibly connecting comprises a non-swiveling snap fastener.

15. The guidance device for a domestic animal of claim 1, wherein the means for reversibly connecting comprises a spring biased clip.

15 16. The guidance device for a domestic animal of claim 1, wherein the secondary collar section comprises a constricting loop having a lead connector, a first segment and a second segment,

said first segment extends from one side of the lead connector, and said second segment extends from the other side of the lead connector and connects with the first segment
20 to form the constricting loop,

said first segment is slidably connected to one of the first end and the second end of the primary collar section,

said second segment is slidably connected to the means for reversibly connecting,

5 whereby, the means for reversibly connecting can be fastened slidably to one of
the second segment and the other of the first end and the second end of the primary collar section
to close the guidance device about the neck of the domestic animal.

17. A guidance device for a domestic animal comprising:

a. a primary collar section having a first end and a second end;

10 b. a secondary collar section connected to one of the first end and the second
end of the primary collar section,

said secondary collar section comprising a constricting loop having a lead
connector, a first segment and a second segment,

said first segment extends from one side of the lead connector, and said
15 second segment extends from the other side of the lead connector and connects with the first segment
to form the constricting loop,

said first segment is slidably connected to one of the first end and the second
end of the primary collar section,

said second segment is slidably connected to the means for reversibly
20 connecting; and

c. means for reversibly connecting the secondary collar section and the other
of the first end and the second end of the primary collar section,

said means for reversibly connecting having a longitudinal axis and being
independent of internal rotation about said longitudinal axis,

5 said means for reversibly connecting having a reversible fastener for attaching
to one of the second segment and the other of the first end and the second end of the primary collar
section,

 said reversible fastener of the means for reversibly connecting having a latch
disposed outwardly relative to the neck of the domestic animal,

10 whereby, the guidance device can be attached to the neck of the domestic
animal independent of twisting, and the means for reversibly connecting can be fastened to one of
the second segment and the other of the first end and the second end of the primary collar section
to close the guidance device about the neck of the domestic animal.

18. The guidance device for a domestic animal of claim 16, wherein the means for
15 reversibly connecting has an aperture and an opening with said opening being associated with the
reversible fastener,

 said aperture lying generally in a first plane and said opening lying generally
in a non-parallel second plane.

19. The guidance device for a domestic animal of claim 18, wherein a line normal
20 to the first plane is perpendicular to a line normal to the second plane.

20. The guidance device for a domestic animal of claim 16, wherein the primary
collar section comprises a plurality of prong links operably connected to form a flexible chain.

21. The guidance device for a domestic animal of claim 16, wherein the means for
reversibly connecting comprises a non-swiveling snap fastener.

25 22. The guidance device for a domestic animal of claim 16, wherein the means for
reversibly connecting comprises a spring biased clip.
